

[Double Number.]

Nos. 67 & 68.-PRICE ONE SHILLING.

THE HISTORY

OF THE

WARS OF THE FRENCH REVOLUTION,

COMPREHENDING

THE CIVIL HISTORY OF GREAT BRITAIN AND FRANCE,

FROM THE

Breaking out of the War in 1792, to the Restoration of a General Peace in 1815.

BY EDWARD BAINES,

Compiled from Official Documents,

And other Sources of Political Information, with strict Impartiality, and a scrupulous Regard to Historic Truth.

LIST of the COINS and MEDALS contained in the inclosed PLATE.

ENGLAND.......* George III. Centenary Medal, struck at the Mint, in sion of the House of Brunswick to the Throne of Great London, August 1, 1814, in Commemoration of the Acces-Britain, on the 1st of August. 1714.

leon-Louis XVIII.

Merlinus Liberatus.

For the Year of our Redemption,

LMANACK.

1825, Being the first after Bitsextile,

And from the Creation of the World, according to the best History, 5833,

AND THE

137th of our Deliverance by K. William

From Popery and Arbitrary Government :

BUT THE 147th. FROM THE

Porrid Popish Nacovite Plot.

Wherein are contained all Things fitting and useful for such a Work; as an Ephemeris of the daily Motions of the Planets, with their various Configurations, Aspects, Conjunctions; Lunations, Eclipses, Astronomical, Astrological, Meteorological Observations; the rising and setting of the Sun, Moon, Planets and fixed Stars, illustrated with Tables of the Tides, Terms, and daily Equation of Clocks; Length and Break, Increase and Decrease, of Days; a Chronology; Remarks on the Divisions of the Heavens, with Judgments of the Eclipses and Seasons, handled according to the Rules of the Ptolomean Astrology, with many other Things relating to the Truth of Astrology.

Calculated for the Meridian of LONDON.

By JOHN PARTRICHE Etiam Mortuus Countert London: PRINTED FOR THE COMPANY By Harrison and Son, Lancaster-coalty Strack, And Sold by George GREENHL, at their Hall, Ladgate-Street. -200-[Price, stitched, Two Shillings and Three Pence.]

N. B. In the Calendar Part, you will find the Planets' Southing inserted to several Days in each Month; and by this Table you may easily find their Rising and Seting. First, find the Longitude for the Day proposed, with which enter this Table, and take out the Semidiurnal Arch thereof, which being added to the Time of Southing, gives the Setting, but subtracted the Rising, nearly; i. e. always within a few minutes,

1825.

PARTRIDGE, 1825.

A compendious Chronology of the most principal Epochas and Æras, with their Beginnings, reduced and fixed to the Years of the Julian Period, the Creation of the World, and to the Years before and after Christ.

37

ECLIPSES of the SUN and MOON, THAT WILL HAPPEN THIS YEAR 1825.

IT appears from calculations made with great care, that the two grand lamps of Heaven will be *four* times eclipsed within the period of the present year, when there will be *two* of each luminary, but only those of the *Moon* will be *visible* in this country.

The first in order of these phenomena will be a very small visible Eclipse of the Moon, which happens on Tuesday the 31st. day of May. This Eclipse Begins at 11h. 53m. 27s. the Middle takes place at 12h. 8m. 23s., and the End at 12h. 23m. 19s. apparent time; Digits eclipsed 14' 6" on the Moon's upper limb. Had we taken the Moon's horizontal instead of her real apparent semidiameter at the time of the middle of this Eclipse at Greenwich the obscuration would have come out only 12' 31" of a digit, which is less than it ought to be, by the difference between this and the preceding quantity. The penumbra which surrounds the dark shadow of the Earth, renders the small Lunar Eclipses less interesting, or useful to science, than they otherwise would be, were the same as clearly defined as the dark disc of the Moon appears during an Eclipse of the Sun. The following Type shows the position of the obscured part of the Moon's disc at the time of its greatest immersion, which is 1° 28' 9" east of the vertical point of the Moon's periphery according to the horizon of Greenwich.

At the middle of this Eclipse the Moon will be vertical in latitude 22° 58′ 55″ south, longitude 2° 1′ west, and the Moon being above the horizon to the greater part of Europe, to the whole of Africa, and South America, to the Cape Verd Islands, Madagascar, and to several other islands scattered over the Indian and Atlantic oceans, the Eclipse will be visible to these different parts of the globe, should the air prove clear at the time.

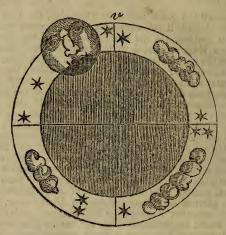

The second is a Solar defect on Thursday, the 16th day of June, and though it takes place at the time when the Sun is above our horizon, yet the austral latitude of the Moon must render this Eclipse *invisible* to the island of Great Britain, as well as to the greater part of our northern hemisphere.

This fine annular Eclipse will be seen to ascend the horizon of that part of South America situated in latitude 17° 17' 40" south, longitude 61° 11' 46" west; this will be the first of its concentric appearance. The central shade will then quickly pass over the middle provinces of Brazil, and entering the southern Atlantic, crosses the equator near the Gulph of Guinea, and the Sun becomes centrally eclipsed when on the meridian in latitude 0° 54' 50" north, longitude 5° 13' 26" west. The annular tract of this Eclipse again crosses the equator near the Island of St. Thomas, and entering upon the coast of Africa moves with great velocity over the unknown parts of that continent, passing over the Channel of Mozambique, and the southern parts of the extensive Island of Madagascar, it leaves the earth soon after it enters the Indian Ocean, in latitude 23° 34' 24" south, longitude 48° 53' 29" east. This Eclipse will be visible to the greater part of South America, and Africa, the Cape Verd Islands, the Island of St. Helena, and also to the Cape of Good Hope, &c. The greatest extent, or the highest latitude to which this Eclipse can attain in our hemisphere is 26° 59', and which in reference to the vortex of the curve of concentric obscuration, will reach within a few miles of the empire of Morocco.

The third of these Eclipses is another of the Moon, on Friday in the afternoon of November the 25th, and which may be expected to be partly visible in this country should the air prove clear at the time. This phenomenon takes place when the Moon is in the 3d degree of II, a few days after she has passed the apogeon point of her orbit, when her semidiameter is only 14' 58" with a commanding latitude of 47' 33", and at the same time the Sun's semidiameter is 16' 15's: hence it may be deduced that the Moon will not immerge far into the

PARTRIDGE, 1825.

Earth's shadow, and of course the Eclipse will be but of a few digits obscuration. At *Greenwich* this Eclipse Begins at 3h. 24m. 22s., the Moon rises that evening at 4h. 3m. 22s. having $2^{\circ} 32' 53''$ of her lower limb obscured, the *Middle* will be at 4h. 21m. 40s., and the End at 5h. 18m. 58s. apparent time; digits eclipsed equal $2^{\circ} 51' 31''$, as shewn by the following type.

The Moon will rise during this Eclipse to Ireland, France, Spain, Italy, and some parts of Africa; but to the most western parts of Europe the Moon may be expected not to rise till after the Eclipse is over. The Moon will be upon the meridian at the time of the greatest obscuration, in longitude 114° 31' east, and vertical in 21° 34' north latitude, which point falls but a few miles S. E. of the large and populous city of Canton in China. This Eclipse will be visible to Borneo, New Guinea, New Holland, and the islands adjacent: it will also be seen over the whole of Russia, China, Hindoostan, -Persia, Turkey, and Arabia, &c.

The fourth and last of these phenomena, is an invisible Eclipse of the Sun, on Friday the 9th day of December, when the true δ takes place at 34m, after 8 o'clock that evening, in 17° 33′ 30″ of \mathcal{I} , and the Moon at the same time having a northern latitude of 31′ 45″, which, under favourable circum-

*

stances might produce a large, and, even a central Eclipse in this country, but not at this time of the year. This Eclipse may be expected to be total along the tract of central appearance where the Sun has a few degrees of elevation above the horizon; and did it so happen that this curve of obscuration lay in a part of the world where there were minds who could justly appreciate the value of such phenomena, we might expect something useful to science from those who are fond of observing the motions of the heavenly bodies.

The middle of the General Eclipse will take place at 28 m. 48s. after our 8 o'clock, and the Sun will be centrally eclipsed on the meridian, 18 seconds after; so that the nonagesimal of the Moon's relative orbit nearly coincides with the central appearance when the same passes the meridian. This will be a large Eclipse, to some parts of the Northern Pacific Ocean, the Sandwich Isles, New Spain, Cuba, East Florida, the Bahama, Virgin, and Caribbee Isles, and also to the Gulf of Mexico and Caribbean Sea. This Eclipse will be visible to some parts of South, as well as N. America; the central appearance begins in the Pacific Ocean, latitude 29° 1' north, longitude 178° 50' east, and after passing over this extensive body of waters crosses some of the provinces of Mexico, and shortly after entering the Atlantic Ocean, leaving the earth when the Sun's centre cuts the horizon of latitude 29°. 35' north, longitude 73° 33' west, and the glorious orb of day sinks beneath the briny wave bereft of its golden, and enlivening beams.

Note. The small and visible Eclipse of the Sun which happened July 8th, 1823, was observed at Epping, and it was found that the Type, &c. (published in this Almanack for that year,) agreed exactly with its appearance, &c. in the heavens.

Other Remarkable Appearances in the Heavens that will happen this Year.

According to my usual practice I shall again inform my readers when they may view the different planets, especially with telescopes of moderate powers, to the greatest advantage.

The planet Mercury may be seen in the mornings of February 10th, June 10th, and October 1st, and again in the evenings of April 22nd, August 19th, and December 13th. Venus will begin to attract notice in the evenings about the middle of February; will have reached her greatest oriental elongation on the 8th of March and maximum brightness on the 14th of April, having, at the latter period, a northern declination of 26 degrees. Hence, during March and April, she may be seen either with the telescope or the naked eye, at almost any hour whilst above the horizon.

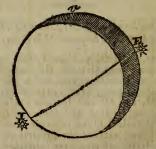

On the 19th of May she passes her inferior σ , and becomes a morning star, and will be an interesting object for the telescope during the two following months.

The planet Venus will also be in σ with Regulus, or the Lion's Heart, and likewise with Mars on the evening of September the 28th, when at the same time she may be expected to eclipse that noted fixed star, but this circumstance will take place before they ascend our horizon.

Mars will not be in β to the Sun this year, and therefore will not be so near the earth, as if that had taken place, and of course his red face will be less conspicuous in the sky than it otherwise would be under more favourable circumstances.

The situation of the planet Jupiter, is such, as to offer the most favourable opportunities for seeing his belts, and satelites during the winter quarter of this year. Saturn, will be in \mathcal{P} to the Sun on the 10th of December, so that during the months of October, November, and December, he will be a very interesting object for the telescope, and the more so, as his Ring will have attained its maximum extent of visible opening.

The moon will make several near appulses to Saturn this year; one of which on Sunday October 30th will be an occultation. The moon will rise 2m. before 7 o'clock, P. M.; and the immersion will take place on the moon's illuminated disk, as at I. at 8h. 10m. 30s. The immersion will be seen at E., and will occur at 9h. 5m. 9s., apparent time the same evening. If the sky be clear, this will be a beautiful sight with a moderately good telescope.

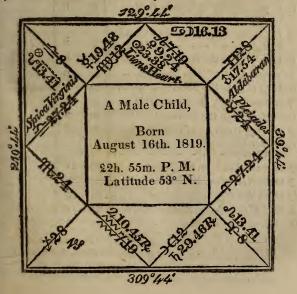

42

ON GENETHLIACAL ASTROLOGY. 43

On Genethliacal Astrology.

Under this department of my annual publication, I shall as usual present my readers with the Horoscope, Directional Arcs in time, and other particulars of such Genitures as are found strikingly interesting. The following is a Nativity of this kind, which was calculated by Mr. J. WORSDALE, with whose observations and remarks most of my readers who are interested in these matters must be highly gratified in the perusal, and at the same time be ready to exclaim, Oh! was but this favoured child on whom the heavens smile, my own dear darling boy! Without detaining the reader with comments of my own, I shall leave Mr. W. to speak for himself, and which he is well able to do on this curious, and interesting subject.

The following remarkable Nativity was calculated by Mr. JOHN WORSDALE, Sen. Professor of Genethliacal Astronomy, near the Cathedral, Lincoln, by whom any person may have any Nativity calculated with accuracy and expedition, or may be taught the only true method of calculating Nativities, either personally or by letter, on reasonable terms.—He also has just published, (in one volume Octavo,) a new and comprehensive System of Genethliacal Astronomy.

This Child is now living, and though his Parents are in hum-ble circumstances, yet his manifest elevation, far above the

ON GENETHLIACAL ASTROLOGY. 45

Sphere of Life in which he was Born, is apparent in the Heavens at the time of Birth .- The Sun who is the general significator of promotion, is posited in his own dignities, in the Angle of Preferment, and Honour; being conjoined with that noble fixed Star, the Lion's Heart, having the benefic Stars for his Satellites, which are angular, and to which he is applying by the Rapt Motion of the Earth. The Moon is in her own House. in a mundane parallel with the Sun, and in Sextile with Mercury, who is also in his own dignities, and terms in the Radix. These are some of the important positions, and configurations, which I allow for the durable advancement, and promotion of this Native, and which will be accomplished by the friendship and assistance of persons in authority, and power. As to riches I am confident that he will be master of considerable property, this station in Life considered,) for the Part of Fortune is in a mundane trine to Jupiter, having exaltation in the radical place of the Moon, and in sextile to Venus, ruler of the Ascendant, and its dispositor, who is angular, and free from affliction. Jupiter is in the Imum Celi, in reception with Saturn lord of the Fourth, and likewise in trine to Mars, lord of the Second. From these, and many other propitious testimonies, it is evident that this Native will obtain his property by Marriage, and the Wills and Legacies of the Dead :- and I shall further observe that this Native will travel, and take many long voyages, which will prove very advantageous, there being no dangers to be apprehended.

The time when these Events will come to pass, may be seen in the preceding Table of Directions.

000000

Astrological Observations relating to the Comet which was visible at the end of 1823, and beginning of 1824.

THIS Comet passed its \bigcirc about the 6th December, when its Geocentric Longitude was in the 13° of \pounds : it 'crossed its Perihelion, or was nearest the Sun on the 9th December, when its distance from that body was only 23 million of miles, being at that time, and for some days, moving within the sphere of Mereury's orbit. The Comet's greatest heliocentric latitude, being the inclination of its orbit, was 75° 56'; it was first seen about the 29th December, and still in the sign \pounds , and moving R with great velocity, at the distance of 78 millions of miles from the earth; it was then making its way towards our globe, and continued to do so till about the 23rd of January, when it was nearest the earth, and its distance from the same was 46 millions of miles, having a geocentric longitude of about 13° of W. This Comet disappeared in the head of Ursa Major, and was last seen in that constellation on the 2nd of February, when its distance from the Sun was 133 millions, and from the earth 54 millions of miles, having its longitude in 25° of \mathfrak{D} , and its latitude about 53 degrees north.

The Ancients were assiduous in their observations, and experience taught them that Comets were preordained of God, to signify Eversions of Empires, and Change of public things : they have sufficiently proved that Comets forebode future events. and that they carry in them the true nature of operative and indicative signs; some modern sages also, assert the same thing, The great Cardanus proves the natural effects of Comets, and Longomontanus sharply reprehends Erastus and others, who allow of virtue in the Planets, yet will not admit of any power or efficacy to comets. But the more we look into History, and the writings both of ancient and modern Philosophers and As tronomers, the more evident does it appear that an awful regard has ever been had of Comets among them, far different from the prejudicate censure of the learned in this age. The effects of this late Comet is likely to be felt in Spain, Portugal, Hungary, Austria, the whole of the Turkish Dominions, both in Europe and Asia, also in Italy, Bohemia, Sicily, and the city of Rome; but from its vicinity to the earth, which moving over the parallels of Russia and Sweden, its baneful influence is likely to be severely felt in those parts.

> When fiery Comets to these Nations rise, And splendid lightning gilds the upper skies, When round their vortex they in fury roll, They fright with dire alarm each guilty soul; As omens certain of a labouring state, Of bloody battles, and a hostile fate. They shake with dreadful awe the pond'rous mass, And desolation make where once blessed order was.

The sly author of *Pastorino's Letters* asserted that Protestantism would be extinct in 1825. Mark me! the Fox will now change his date, and pretend that he meant 1828, or some later period. 'Tis all fudge.

THE WINTER QUARTER

Judicium Astrologicum, pro Anno 1825; or an Astrological Judgement upon the four quarterly Ingresses of the present Year; and first of the Brumal Ingress, or Winter Quarter.

- Rece

THIS Quarter begins at such time as the Earth in her annual course round the Sun, reaches the first increment of the tropical sign 5; when the Sun appears to us in the opposite point of the ecliptic or first scruple of vo: which takes place this year on Tuesday December 21st. 1824, at 2m. 6s. after 8 o'clock, P. M. when 18° 21' of Ω cut the eastern angle and 2° 47' the southern; at the same time we have \mathcal{Y} and \mathcal{Y} both \mathcal{R}_2 , and above the horzion, with all the other planets direct and below horizon. Mars and 9 in the 6th house, and having nearly the same degree of longitude, denotes a sickly time to those countries under the signs we and man: Russia, Denmark, India, and Greece, are more immediately concerned in respect to this unhappy configuration. Many transcendant actions are now upon the stage of the world, and many nations of Europe appear active, and we hear of various reports from France, Germany, Spain, and Italy. Much fraud and subtility is practised in a neighbouring nation. Brutal ignorance, a superstitious veneration for the dogmas of the priests, are considered high attainments by our continental politicians of the Holy Alliance :- this is a melancholy prospect for the rising generations, who are so unfortu-nate as to live under the controul of such narrow minded policy.

THE SPRING QUARTER;

Or the Sun's transit through γ , δ , and II.

AT the commencement of this quarter, which happens on Sunday, March 20th, at 9h. 19m. P. M. we find \mathfrak{M} cuts the eastern horizon, and \mathfrak{Q} the southern angle, when 5th degree of the former sign is on the cusp of the ascendant, and the 17th degree of the latter on that of the Medium Cooli. At the same time, \mathfrak{Q} is in the 9th house, \mathfrak{h} in the 8th, the house of death, \mathfrak{Q} in the 7th, and almuten of the year, $\mathfrak{S}^{\mathsf{T}}$ and \mathfrak{Q} in the 6th, \mathfrak{O} and \mathfrak{P} in the 5th. From these considerations, and from the aspects formed by these bodies, we may expect this to be a favourable season for the productions of the earth, on the other hand I am fearful that it will prove a sickly time, especially amongst those of the labouring class, when febrile symptoms will be found to be very predominant. Although Mars is lord of the ascendant, and in the fiery trigon, yet I have reason to hope that the mild and persuasive influence of Q at this ingress will so far predominate, as in a great degree to lessen the unhappy effects that are attributed to this infortune of the planetary bodies. Bella matronis detestata.

THE SUMMER QUARTER;

Or the Sun's transit through ∞ , Ω , and \mathfrak{m} .

THIS quarter begins on *Tuesday*, the 21st day of *June*, at. 48m. after 6 o'clock, P.M. when the 12th degree of $\underline{\tau}$ is on the ascendant and the 13th degree of $\underline{\Delta}$ on the *Medium Cati*. All the planets, with the exception of H, are occidental, $\underline{\lambda}$ is lord of the ascendant, but \underline{Q} is again, as in the last quarter the prevailing planet, she is besides in the 5th mundain house, the abode of children, pleasures, and of all kinds of recreations, and delights. This is likely to be a fine summer for the fruits of the earth. And though there are likely to be various consultations, and negociations amongst the different states of Europe, yet they may be expected to tend more to the consolidation of the present peace, than to any thing of an hostile nature; unless the new Monarch of a neighbouring nation should be as priestridden as his predecessor.

THE AUTUMN QUARTER;

Or the Sun's transit through Δ , \mathfrak{m} , and \mathfrak{l} .

AT the commencement of this quarter the sun cuts the equinoctial, or enters the sign *libra*, which this year is found to take place on *Friday*, the 23rd day of *September*, at 42*m*. after 8 o'clock in the morning, when 28° \pm ascend, and 8° of Q are on the meridian, at the same time we have the following aspects of the planetary bodies $\pm \partial Q$ D, $\partial \partial'$ D, $\triangle b$ D, $\square b \nabla$, $\sigma' Q$, * Q + b, and $* b \sigma'$. I have not room to say much on this quarter, though these aspects are of considerable importance in an astrological point of view, and which I must leave for the judgment of my readers to construe. Our cabinet counsel very busily employed in matters relative to foreign states, as well as with those at home.
